

430.211 Programming Methodology (프로그래밍 방법론)

Sorting Algorithm part 2

Lab2 #03

Fall 2025

Outline

- **Recursion**
 - **What is recursion?**
- Incremental Algorithm
 - Merge sort
 - Quick sort
- Linear time sorting algorithm
 - Counting, bucket, radix sorting...

Recursion

- Recursion is the process where a **function calls itself**.
- It is often used to solve problems by **breaking them into smaller subproblems**.

Recursion: Sum function

- Recursion can be defined by two key components:
 - **Base case**
 - The condition that stops the recursion.
 - **Recursive step**
 - Calling the function on a smaller version of itself
 - (ex) $\text{sum}(n) = n + \text{sum}(n-1)$

Base case	→	$\begin{cases} a_1 = 1 \\ a_n = a_{n-1} + 1 \quad (n \in \{2, 3, 4, \dots\}) \end{cases}$
Recursive step	→	

Recursion : Factorial function

- For integer $n \geq 1$, the factorial function is defined by

$$n! = (n) \cdot (n - 1) \cdot (n - 2) \cdots (1).$$

- It can be represented **recursively**.

Base case	→	{	$1! = 1$
Recursive step	→		$n! = n \cdot (n - 1)!$

Recursion : Factorial

- Pseudocode

```
factorial(n)  
  if n == 1  
    return 1  
  else  
    return = n * factorial(n - 1)
```

- Tree structure

Recursion : Factorial

- Code

Not
recursion

Base case

Recursive
step

```
1  #include <iostream>
2  #include <string>
3  using namespace std;
4  int factorial_1(int n)
5  {
6      int result = 1;
7      for (int i = 1; i <= n; i++)
8          result *= i;
9      return result;
10 }
11 int factorial_2(int n)
12 {
13     if (n == 1)
14         return 1;
15     else
16         return n*factorial_2(n-1);
17 }
18 int main()
19 {
20     int n;
21     cout << "Enter a positive integer : " << endl;
22     cin >> n;
23     cout << "For loop result : " << factorial_1(n) << endl;
24     cout << "Recursive result : " << factorial_2(n) << endl;
25     return 0;
```

Outline

- Recursion
 - What is recursion?
- **Incremental Algorithm
(Divide and Conquer algorithms)**
 - Merge sort
 - Quick sort
- Linear time sorting algorithm
 - Counting, bucket, radix sorting...

Divide and Conquer

- **Divide**
 - Break the problem into smaller sub-problems
- **Conquer**
 - Solve each sub-problem by recursively calling the function until it is solved
- **Combine**
 - Merge the solutions of the sub-problems to get the final solution for the whole problem.

Divide and Conquer

Merge Sort

- Divide the array into halves until each sub-array has length 1
- Then, keep merging the halves together in the correct order

Merge Sort

```
void merge_sort(int* array, int l, int r) {  
    if (l < r)  
    {  
        int q = (l + r) / 2;  
        merge_sort(array, l, q);  
        merge_sort(array, q + 1, r);  
        merge(array, l, q, r);  
    }  
}
```

Merge two sorted list

Merge Sort

MERGE(A, p, q, r) p : left, q : pivot, r : right index

```

1   $n_1 \leftarrow q - p + 1$ 
2   $n_2 \leftarrow r - q$ 
3  create arrays  $L[0, \dots, n_1]$  and  $R[0, \dots, n_2]$ 
4  for  $i \leftarrow 0$  to  $n_1 - 1$ 
5      do  $L[i] \leftarrow A[p + i]$ 
6  for  $j \leftarrow 0$  to  $n_2 - 1$ 
7      do  $R[j] \leftarrow A[q + j + 1]$ 

```

Fill L and R
(Copy array)

Fill L and R (Copy array values into L,R)

```

8    $i \leftarrow 0$ 
9    $j \leftarrow 0$ 
10  for  $k \leftarrow p$  to  $r$ 
11      do if  $L[i] \leq R[j]$ 
12          then  $A[k] \leftarrow L[i]$ 
13               $i \leftarrow i + 1$ 
14          else  $A[k] \leftarrow R[j]$ 
15               $j \leftarrow j + 1$ 

```

Sorting

Merge Sort

left pivot right

```
void merge(int* array, int p, int q, int r) {  
    int n1 = q - p + 1;  
    int n2 = r - q;  
  
    //////////// IMPLEMENT HERE ////////////  
  
    //////////////////////////////////////  
}
```

```
void merge_sort(int* array, int l, int r) {  
    if (l < r)  
    {  
        int q = (l + r) / 2;  
        merge_sort(array, l, q);  
        merge_sort(array, q + 1, r);  
        merge(array, l, q, r);  
    }  
}
```

Merge Sort

left pivot right

```
void merge(int* array, int p, int q, int r) {
    int n1 = q - p + 1;
    int n2 = r - q;

    //////////// IMPLEMENT HERE ////////////
    int L[n1];
    int R[n2];
    for (int i = 0; i < n1; i++){
        L[i] = array[p+i];
    }
    for (int i = 0; i < n2; i++){
        R[i] = array[q+i+1];
    }
    int i = 0;
    int j = 0;

    for (int k = p; k <= r; k++){
        if (i == n1) array[k] = R[j++];
        else if (j == n2 || L[i] <= R[j]) array[k] = L[i++];
        else array[k] = R[j++];
    }
    //////////////////////////////////////
}
```

```
void merge_sort(int* array, int l, int r) {
    if (l < r)
    {
        int q = (l + r) / 2;
        merge_sort(array, l, q);
        merge_sort(array, q + 1, r);
        merge(array, l, q, r);
    }
}
```

Merge Sort

- Pros
 - Nice time complexity $O(n \log n)$

- Cons

At each recursive step, merging the sorted arrays takes total $O(n)$ time

- Additional memory is required to store the divided segments

Outline

- Recursion
 - What is recursion?
- **Incremental Algorithm
(Divide and Conquer algorithms)**
 - Merge sort
 - Quick sort
- Linear time sorting algorithm
 - Counting, bucket, radix sorting...

Quick Sort

7	2	1	6	8	5	3	4
---	---	---	---	---	---	---	---

**Choose a pivot
(end point case)**

2	1	3	4	8	5	7	6
---	---	---	---	---	---	---	---

Partition

Smaller than pivot

Larger than pivot

2	1	3	4	8	5	7	6
---	---	---	---	---	---	---	---

**Recursive Sorting on
both left and right of
the pivot**

2	1	3	4	5	6	7	8
---	---	---	---	---	---	---	---

...

Quick Sort

- **Pseudo Code**

- A : given list, p : start of the list, r : end of the list, q : pivot

QUICKSORT(A, p, r)

```
1  if  $p < r$ 
2     $q = \text{PARTITION}(A, p, r)$ 
3    QUICKSORT( $A, p, q - 1$ )
4    QUICKSORT( $A, q + 1, r$ )
```

PARTITION(A, p, r)

```
1   $x = A[r]$            Set end as pivot
2   $i = p - 1$           $i$ : For left
3  for  $j = p$  to  $r - 1$   $j$ : For right
4      if  $A[j] \leq x$     If Right  $\leq$  Pivot
5           $i = i + 1$ 
6          exchange  $A[i]$  with  $A[j]$ 
7  exchange  $A[i + 1]$  with  $A[r]$ 
8  return  $i + 1$        Pivot index after
                       partition
```

Quick Sort

- Why Pseudo Code works?
 - Let's see the **PARTITION(A,p,r)**

PARTITION(A, p, r)

```
1   $x = A[r]$ 
2   $i = p - 1$ 
3  for  $j = p$  to  $r - 1$ 
4      if  $A[j] \leq x$ 
5           $i = i + 1$ 
6          exchange  $A[i]$  with  $A[j]$ 
7  exchange  $A[i + 1]$  with  $A[r]$ 
8  return  $i + 1$ 
```

i: For left
j: For right

Input A

$p = 0, r = 7$

7	2	1	6	8	5	3	4
---	---	---	---	---	---	---	---

↑ $i = -1$

$x = A[7] = 4$

$i = p - 1 = -1$

for- loop ($j = 0$)

$A[j] = 7 > x = 4$

Result

7	2	1	6	8	5	3	4
---	---	---	---	---	---	---	---

Quick Sort

- Why Pseudo Code works?
 - Let's see the **PARTITION(A,p,r)**

PARTITION(A, p, r)

```
1   $x = A[r]$ 
2   $i = p - 1$ 
3  for  $j = p$  to  $r - 1$ 
4      if  $A[j] \leq x$ 
5           $i = i + 1$ 
6          exchange  $A[i]$  with  $A[j]$ 
7  exchange  $A[i + 1]$  with  $A[r]$ 
8  return  $i + 1$ 
```

Input A

$p = 0, r = 7$

7	2	1	6	8	5	3	4
---	---	---	---	---	---	---	---

↑ $i=0$

for- loop ($j = 1$)

$A[j] = 2 \leq x = 4$

$i = i + 1 = 0$

swap ($A[i], A[j]$)

Result

2	7	1	6	8	5	3	4
---	---	---	---	---	---	---	---

Quick Sort

- Why Pseudo Code works?
 - Let's see the **PARTITION(A,p,r)**

PARTITION(A, p, r)

```
1   $x = A[r]$ 
2   $i = p - 1$ 
3  for  $j = p$  to  $r - 1$ 
4      if  $A[j] \leq x$ 
5           $i = i + 1$ 
6          exchange  $A[i]$  with  $A[j]$ 
7  exchange  $A[i + 1]$  with  $A[r]$ 
8  return  $i + 1$ 
```

Input A

$p = 0, r = 7$

2	7	1	6	8	5	3	4
---	---	---	---	---	---	---	---

↑ $i=1$

for- loop ($j = 2$)

$A[j] = 1 \leq x = 4$

$i = i + 1 = 1$

swap ($A[i], A[j]$)

Result

8  return  $i + 1$ 
```

Result

2	1	3	4	8	5	7	6
---	---	---	---	---	---	---	---

pivot

Left is smaller than pivot

Right is larger than pivot

Quick Sort

```
int quick_partition(int* array, int p, int r) {  
    int i = p - 1;  
    int pv = array[r];  
  
    //////////// IMPLEMENT HERE ////////////  
  
    ///////////////////////////////////////////  
  
    return i+1;  
}
```

```
void quick_sort(int* array, int l, int r) {  
    int q;  
    if (l < r)  
    {  
        q = quick_partition(array, l, r);  
        quick_sort(array, l, q - 1);  
        quick_sort(array, q + 1, r);  
    }  
}
```

Quick Sort

```
int quick_partition(int* array, int p, int r) {
    int i = p - 1;
    int pv = array[r];

    //////////// IMPLEMENT HERE ////////////

    for (int j= p ; j < r; j++){
        if (array[j] < pv){
            i++;
            swap (array[i], array[j]);
        }
    }
    swap(array[i+1], array[r]);

    //////////////////////////////////////////

    return i+1;
}
```

```
void quick_sort(int* array, int l, int r) {
    int q;
    if (l < r)
    {
        q = quick_partition(array, l, r);
        quick_sort(array, l, q - 1);
        quick_sort(array, q + 1, r);
    }
}
```

Quick Sort

- **Pros**

- Average time complexity $O(n \log n)$
- Best-case time complexity $O(n \log n)$
- Do not need additional memory

- **Cons**

- Not stable
 - Performance depends on pivot selection
 - Worst-case time complexity $O(n^2)$

Outline

- Recursion
 - What is recursion?
 - Divide and Conquer algorithms:
 - Merge sort
 - Quick sort
- Linear time sorting algorithm
 - **Counting**, bucket, radix sorting...

Counting Sort

- Heap, Merge, Quick Sort: $O(n \log n)$
- Are these algorithms **always** optimal?
 - No! (It depends on the problem or resources)
- Linear time sorting algorithm?
 - Counting sort.
 - Radix sort, and so on.

Counting Sort

- Counting sort
 - Phase-1) Given array, find maximum value of the array

- Phase-2) Make counting array size of **(maximum value+1)**
Initialize it with 0.

Index	0	1	2	3	4	5	6	7	8
Count array	0	0	0	0	0	0	0	0	0

Counting Sort

- Counting sort
 - Phase-3) Calculate counts of each element and store it in count array.

Original array

4	2	2	8	3	3	1
---	---	---	---	---	---	---

Index	0	1	2	3	4	5	6	7	8
Count array	0	1	2	2	1	0	0	0	1

- Phase-4) Calculate cumulative sum.

Index	0	1	2	3	4	5	6	7	8
Count array	0	1	3	5	6	6	6	6	7

From cumulative sum, we can find suitable location for each elements.

Counting Sort

- Counting sort
 - Phase-5) Sorting: Starts with last element of original array.

Original array	4	2	2	8	3	3	1		
Counting array	0	1	3	5	6	6	6	7	
	0	1	2	3	4	5	6	7	8
Sorted array	1								

Step1

i=size-1

While i>=0:

sorted[counts[original[i]]-1]= original[i];

count[original[i]] -= 1;

i-=1;

Counting Sort

- Counting sort
 - Phase-5) Sorting:

Original array	4	2	2	8	3	3	1		
Counting array	0	0	3	5	6	6	6	7	
	0	1	2	3	4	5	6	7	8
Sorted array	1					3			

Step2

Original array	4	2	2	8	3	3	1		
Counting array	0	0	3	4	6	6	6	6	7
	0	1	2	3	4	5	6	7	8
Sorted array	1			3	3				

Step3

Counting Sort

- Counting sort
 - Phase-5) Sorting:

Original array	4	2	2	8	3	3	1	
Counting array	0	0	3	3	6	6	6	7
	0	1	2	3	4	5	6	7
Sorted array	1			3	3		8	
	Step4							
Original array	4	2	2	8	3	3	1	
Counting array	0	0	3	3	6	6	6	6
	0	1	2	3	4	5	6	7
Sorted array	1		2	3	3		8	
	Step5							

Counting Sort

- Counting sort
 - Phase-5) Sorting:

Original array	4 2 2 8 3 3 1								
Counting array	0 0 2 3 6 6 6 6 6 0 1 2 3 4 5 6 7 8								
Sorted array	1 2 2 3 3 8							Step6	

Original array	4	2	2	8	3	3	1		
Counting array	0	0	1	3	6	6	6	6	
	0	1	2	3	4	5	6	7	8
Sorted array	1	2	2	3	3	4	8		
								Step7	

Counting Sort

```
void counting_sort(int* array, unsigned int size) {  
    // Find Maximum value  
    int max_value= array [0];  
    for (int i = 1; i < size; i++){  
        if (array[i] > max_value){  
            max_value = array[i];  
        }  
  
    //Initialization  
    int counts[max_value+1];  
    for (int i=0; i<max_value+1; i++){  
        counts[i]= 0;  
    }  
    int sorted[size];
```

Implement
Phase 3,4,5 described in previous
slides.

```
////////////////////////////////////  
// update array with sorted array.  
for (int i = 0; i < size; i++)  
    array[i] = sorted[i];  
}
```

Counting Sort

```
void counting_sort(int* array, unsigned int size) {  
    // Find Maximum value  
    int max_value= array [0];  
    for (int i = 1; i < size; i++){  
        if (array[i] > max_value){  
            max_value = array[i];  
        }  
  
    //Initialization  
    int counts[max_value+1];  
    for (int i=0; i<max_value+1; i++){  
        counts[i]= 0;  
    }  
    int sorted[size];  
  
    // Counting  
    //////////// IMPLEMENT HERE ////////////  
    for (int i=0; i<size;i++){  
        counts[array[i]] += 1;  
    }  
    ///////////////////////////////////////////  
    // Cumulative sum  
    //////////// IMPLEMENT HERE ////////////  
    for (int i=1; i<=max_value; i++){  
        counts[i] += counts[i-1];  
    }  
    ///////////////////////////////////////////  
}
```

Implement
Phase 3,4,5 described in previous
slides.

```
    // Sorting  
    //////////// IMPLEMENT HERE ////////////  
    int i=size-1;  
    while (i>=0) {  
        sorted[counts[array[i]]-1] = array[i];  
        counts[array[i]] -= 1;  
        i -= 1;  
    }  
    ///////////////////////////////////////////  
    // update array with sorted array.  
    for (int i = 0; i < size; i++)  
        array[i] = sorted[i];  
}
```

Counting Sort

- Pros
 - $O(n + k)$
 - where n = array size and k = value range (=max-min)
 - Linear time complexity if k is smaller than the array size n
- Cons
 - But if k is much larger than array size n (e.g., $n^2, n^3 \dots$, it is very inefficient)
 - Additional space memory for saving counting array

Assignment

1. Implement **Bubble Sort** and **Insertion Sort** recursively, not iteratively
2. **Stooge Sort** → Next page ..

Assignment

2. Implement the stooge-sort algorithm

1) Swap initial & last element (since $2 > 1$)

2) Sort the former 2/3 elements

3) Sort the latter 2/3 elements

4) Again, sort the former 2/3 elements

Algorithm:

1) If the index 0 value is greater than the last index value, **swap them**.

2) If there are 3 or more elements in the array,

1. Recursively sort the former 2/3 of the array
2. Recursively sort the latter 2/3 of the array
3. Recursively sort the former 2/3 of the array

Assignment

2. Implement the stooge-sort algorithm

1) Swap initial & last element (since $2 > 1$)

2) Sort the former 2/3 elements

3) Sort the latter 2/3 elements

4) Again, sort the former 2/3 elements

1) No swap.

2) Sort the former 2/3 elements

3) Sort the latter 2/3 elements

4) Again sort former 2/3 elements

Assignment

- Submit the implementation codes
 - **No hidden test case** but try it yourself for other test cases
 - Due date : 4/22 14:30 PM
 - Push submit (제출) button on Elice

Attendance Check

- Quiz
